

## **ARC Commodity Factor Risk Model Monthly Report April 2025**

The Asset Risk Company (ARC) Commodity Model is a cross-sectional commodity factor model. The model contains 50 of the most widely traded commodity products with approximately 1,200 futures in total over all maturities. All futures in the model have exposures to sectors, sub-sectors, style and trading factors such as basis, momentum, and open interest. The model is estimated daily with 25 years of history. It provides a framework for managing risk and investment decision-making.

In this report, you will find:

- Performance of Sectors, Sub-Sectors and Style and Trading Factors
- Examples of Factor Tilted Portfolios (Low Vol, Value, Momentum, Backwardation)
- Factor Based Risk Decomposition of Popular Commodity Indexes (BCOM, GSCI)
- Inflation prediction

The ARC Commodity Model is a powerful tool to help many constituencies in the financial industry, trading, and real economy. Some of the applications of the model are very straightforward, but some uses of the model are more nuanced. We recommend this short piece that provides details on both common and novel use cases for a commodity factor model: <https://www.assetriskcompany.com/whyfactor.html>. Precious	-0.7%	12.5%	11.7%	18.9%

April was marked by significant market volatility, and commodities were no exception. The Energy sector saw sharp declines, down 5%, with Crude Oil falling 6.5%. Base Metals also dropped 6%, while Precious Metals remained mostly flat despite a brief recovery in Gold. The one bright spot came from Agriculture, where both Grains & Oilseeds and Softs posted gains of 2.3%, while Proteins are up 8.3% YTD. As a reminder, ARC sectors and sub-sectors returns are not estimated using a static

configuration of commodity weightings. The returns come naturally from a cross-sectional regression of the 1,200 assets in the model and therefore cover the entire term structure. For instance, Natural Gas has more than 120 maturities in the model. The model uses all of that information to derive sector and subsector returns and one can think of our sectors as risk weighted on the entire curve.

**Table 2. Styles/Trading Factors Performance**

<b>Factor</b>	<b>April 25</b>	<b>2025</b>	<b>5 Year Return</b>	<b>5 Year Volatility</b>
<b>Basis</b>	<b>-1.7%</b>	<b>-3.3%</b>	<b>-7.8%</b>	<b>4.3%</b>
<b>Open Interest</b>	<b>-2.7%</b>	<b>0.2%</b>	<b>2.1%</b>	<b>4.2%</b>
<b>Momentum</b>	<b>-0.9%</b>	<b>-0.5%</b>	<b>1.3%</b>	<b>5.8%</b>
<b>ST Momentum</b>	<b>-0.8%</b>	<b>2.0%</b>	<b>-7.5%</b>	<b>5.4%</b>
<b>Trading Activity</b>	<b>-0.6%</b>	<b>-1.4%</b>	<b>-0.7%</b>	<b>2.2%</b>
<b>Volatility</b>	<b>1.2%</b>	<b>-1.0%</b>	<b>3.6%</b>	<b>8.8%</b>
<b>ST Volatility</b>	<b>-0.2%</b>	<b>-1.2%</b>	<b>-0.6%</b>	<b>8.0%</b>

Except for the Volatility factor, all factors are down this month. Interestingly the Open Interest factor was down almost 3%. The Momentum factor is down now for the year. The factor replicating portfolios are not a practical way to trade and consist of positions (both long and short) in most of the instruments in the model's universe. We provide a much more parsimonious factor-tilted (long only) portfolio later in this analysis.

## Factor Tilted Portfolios Performance Report:

As shown above there are some clear patterns emerging for the ARC Commodity Styles and Trading Factors. However in order to take advantage of these trends, ARC has created long-only tilted versions. Our findings, based on 25 years of data, are:

- Low Volatility and Low Momentum (Value), Low Basis (Extreme Backwardation) are reliable and produce much better performance and risk than traditional indices
- High Momentum performed well over the last 5 years
- High Basis is reliable in underperforming the indices

Table 3 presents the performance of equally weighted, factor-tilted portfolios built from five liquid futures markets, rebalanced monthly. Momentum continues to deliver strong results following an exceptional year in 2024. While traditional trend-following strategies have struggled, the cross-sectional momentum approach has performed notably well in 2025. The long-only, momentum-tilted portfolio declined by 2.8%, significantly outperforming the BCOM benchmark, which fell 5.1%.

## Commodity Indices Risk Decomposition

Energy is the largest sector in GSCI but the smallest in BCOM. Both indices have high z-scores with respect to Open Interest reflecting the fact that the indices' constituents are weighted more heavily on the front-month contract.

Table 4: Factor Exposures

Factors Exposures	BCOM	GSCI
Agriculture	0.37	0.29
Energy	0.27	0.50
Metals	0.36	0.21
Basis	-0.02	-0.15
Open Interest	2.21	1.73
Momentum	0.62	0.01
ST Momentum	-0.04	-0.33
Trading Activity	1.70	1.36
Volatility	0.24	0.07
ST Volatility	0.29	0.24

We use a 6 month half-life for this risk decomposition so the model is fairly reactive to market conditions. Despite different sector allocations, both indices have similar risk and exposures to styles. A portfolio that is long/short would be evaluated on the breakout between systematic exposures and whether idiosyncratic risk. Long-only managers will want to find their exposures relative to their benchmark. As shown below in the correlation tables, sector correlations with style factors are relatively small. The model is able to separate risk due to sector allocation and styles risk. All risk is not equal. Systematic risk can display non-normal behavior when compared to specific or idiosyncratic risk. Both types of risks are driven by fluctuation, but systematic risk is

driven by the “crowd” expressing some thematic bet. The systematic risk is related to market risk.

## **Inflation:**

Empirical testing finds that the ARC Commodity Model is an excellent predictor of breakout moves in the headline number, both in bouts of inflation and deflation. For April, we predict a flat CPI, and a decrease year-on-year (Inflation). Reach out to [info@assetriskcompany.com](mailto:info@assetriskcompany.com) for our estimate.

## Factor Correlations:

Long-term correlations between sectors and style factors are very low. The model is able to separate sector allocation risk from style risk providing key insights in the real key drivers of risk and performance of a portfolio.

## Conclusion:

In this report, we have shown the factor performance driving the commodity markets. Using the ARC Commodity model, style-tilted portfolios have shown great performance and seem to be suitable benchmarks for active managers to track. We then conducted an analysis into the risk dynamics of two major commodity indices. The view of commodities as diversifiers is quite accurate. All of this was possible with the ARC model. The model enables the user to look at their book or portfolio and how it fits into their thesis as well as how it fits in the broader economic landscape.
